Synthesis of fullerenes with CH₄, Ti, and Ti/CH₄

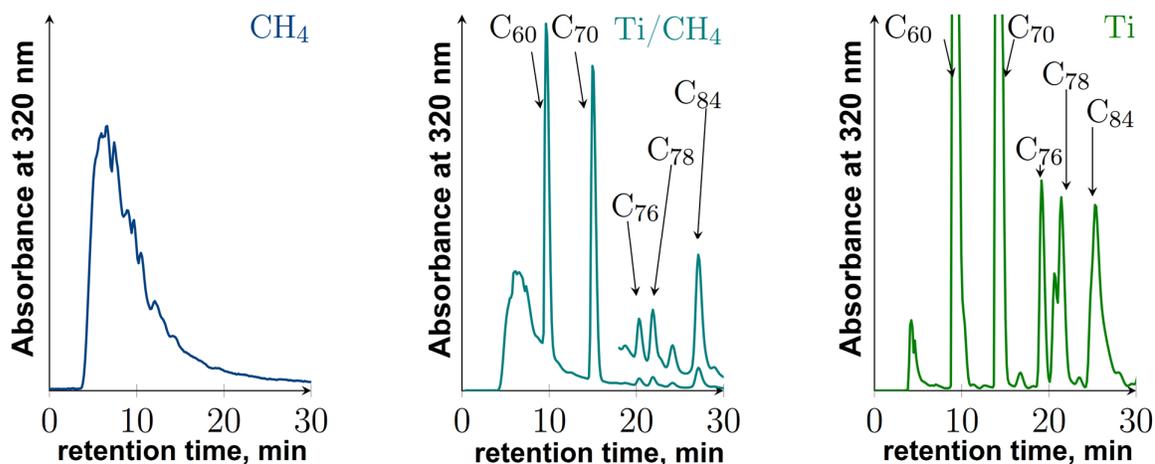

Figure S1a. HPLC chromatograms of raw fullerene mixtures synthesized in different conditions (Buckyprep column, toluene as eluent), from left to right: graphite/CH₄ (note the absence of well-defined peaks due to C₆₀ and C₇₀), Ti-graphite/CH₄, and Ti-graphite without methane. In the Ti/CH₄ system, the yields of C₆₀ and C₇₀ are almost equal, whereas the distribution of higher fullerenes (retention times 20-30 min) is very different from that in Ti-graphite system or in standard empty fullerene synthesis (the latter two are very similar).

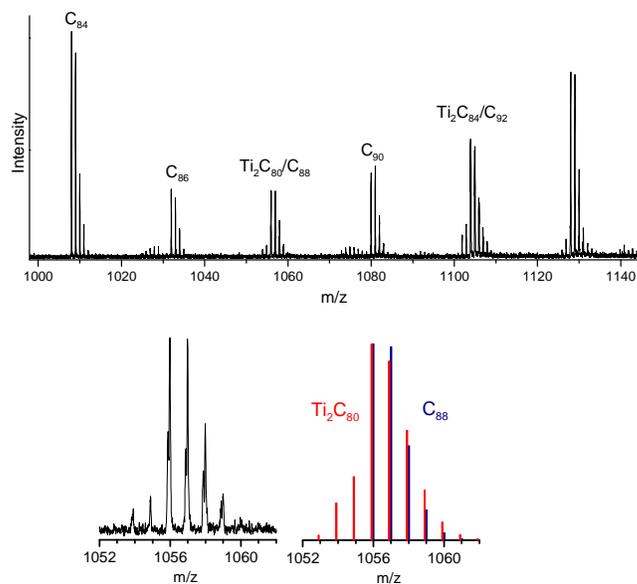

Figure S1b. Left: Mass-spectrum of the raw fullerene mixture from Ti synthesis. The spectra are dominated by empty fullerenes, but Ti₂C_{2n} structures can be also detected due to characteristic isotopic pattern of Ti. Right: experimental isotopic distribution for Ti₂C₈₀/C₈₈ peaks compared to theoretical for Ti₂C₈₀ (red) and C₈₈ (dark blue).

Separation of $\text{Sc}_2\text{TiC@C}_{78}$

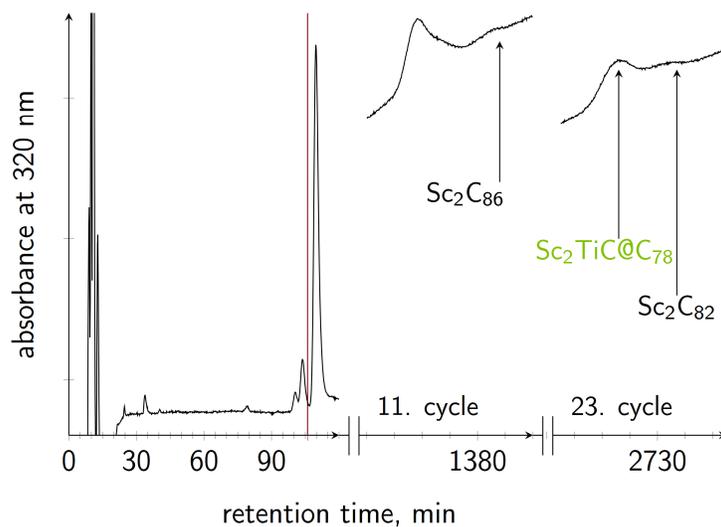

Figure S2. Fraction A (see Fig.1 in the manuscript) was subjected to recycling HPLC with Buckyrep column and toluene as eluent. Pure $\text{Sc}_2\text{TiC@C}_{78}$ was obtained after 23 cycles after removal of Sc_2C_{86} and Sc_2C_{82} .

Separation of $\text{Sc}_2\text{TiC@I}_h\text{-C}_{80}$

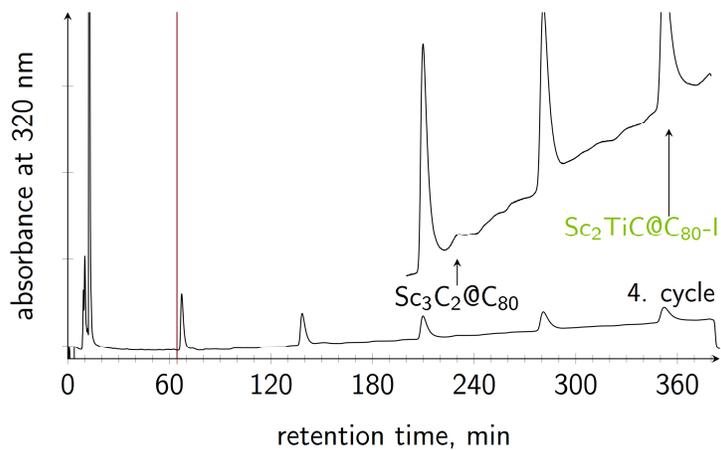

Figure S3. Fraction B was subjected to recycling HPLC with Buckyrep-M column and toluene as eluent. $\text{Sc}_3\text{C}_2\text{@C}_{80}$ (ca 15 % of the fraction) was removed after 4 cycles leaving pure $\text{Sc}_2\text{TiC@I}_h\text{-C}_{80}$.

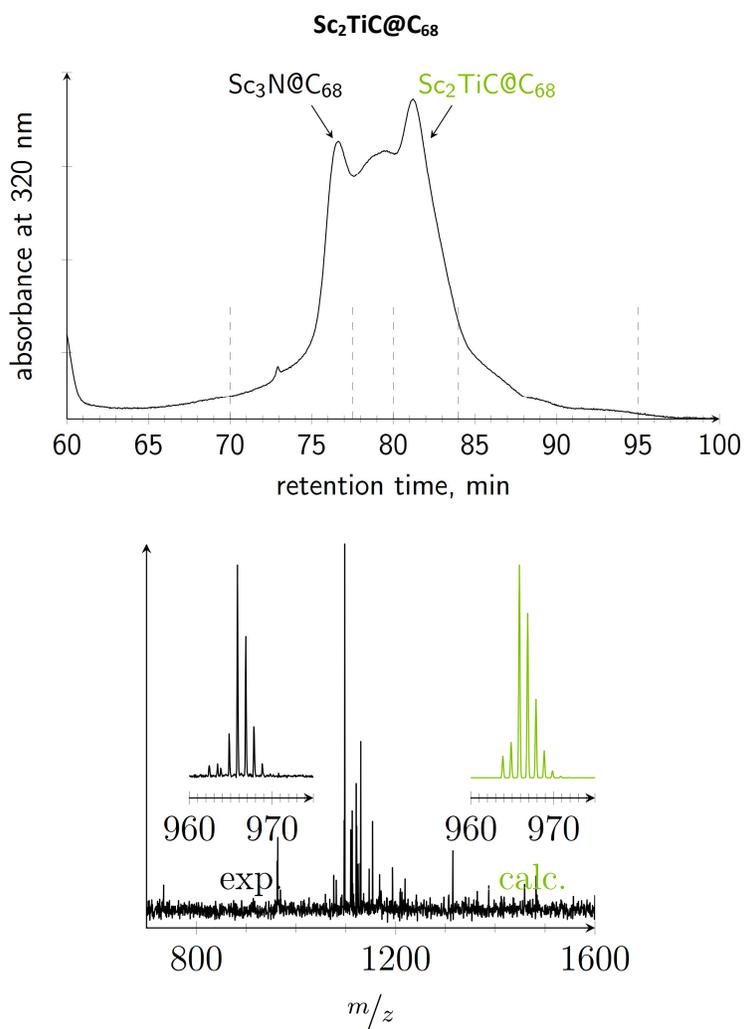

Figure S4. HPLC of the fraction containing $Sc_2TiC@C_{68}$ and $Sc_3N@C_{68}$ (4 Buckyperp columns, toluene as an eluent) and mass-spectrum of the fraction proving the presence of $Sc_2TiC@C_{68}$ (inset, peak maximum at 966). Low yield of the compound prevents its further separation.

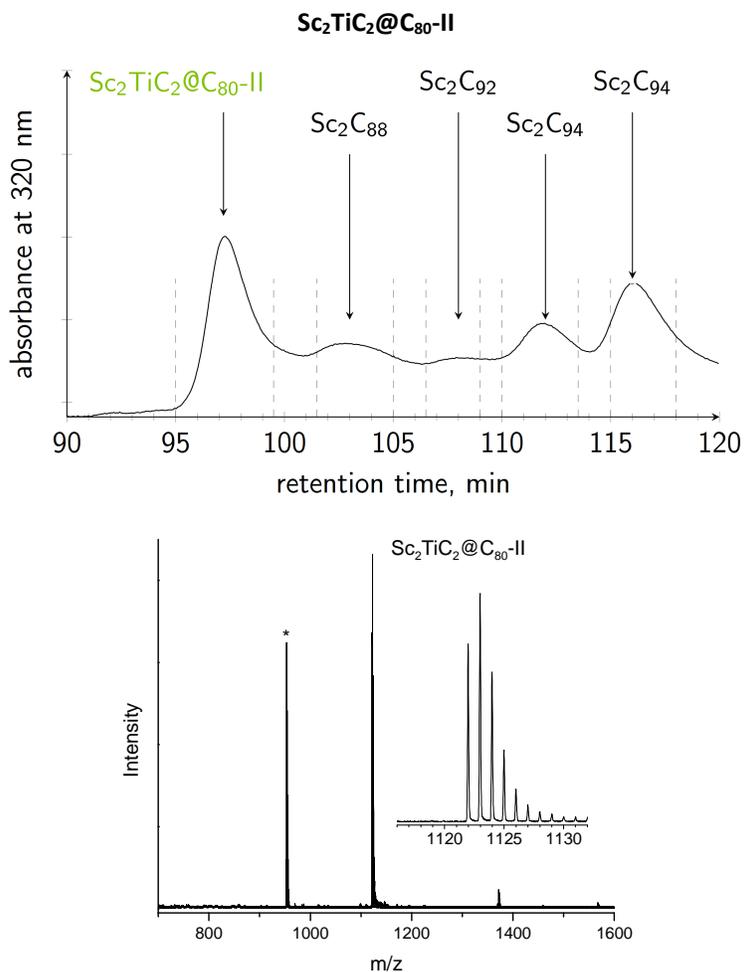

Figure S5. Top: HPLC curve of the fraction containing $\text{Sc}_2\text{TiC}_2@\text{C}_{80}\text{-II}$ (4 Buckyperp columns, toluene as an eluent). Bottom: positive-ion MALDI mass-spectrum of the $\text{Sc}_2\text{TiC}_2@\text{C}_{80}\text{-II}$ fraction (sulfur is used as a matrix, the feature marked with asterisk is due to the presence of matrix; note that the measurement were performed with ca 5% ^{13}C -enriched sample, hence isotopic distribution is different from that shown in Fig. S6)

Mass-spectra of purified Sc-Ti carbide clusterfullerenes

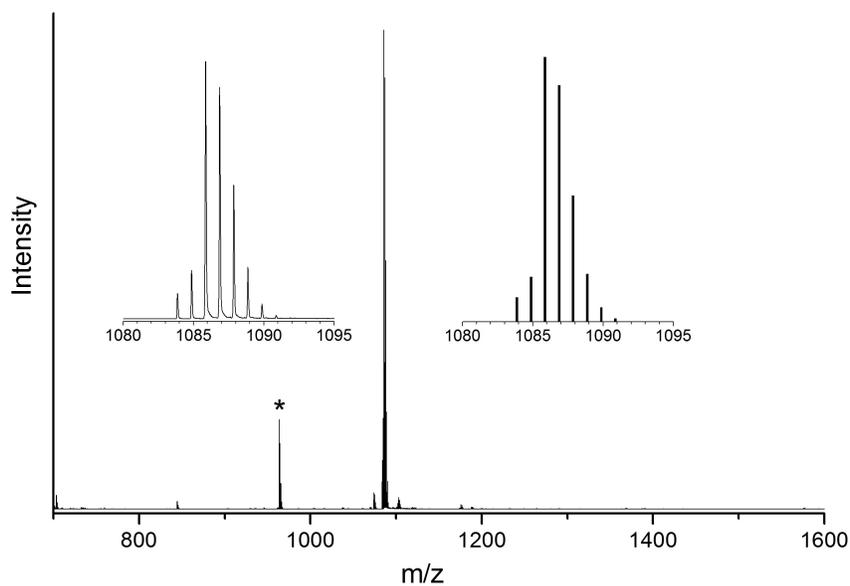

Figure S6a. Positive-ion MALDI Mass-spectrum of $\text{Sc}_2\text{TiC}@C_{78}$ (sulfur is used as a matrix, the feature marked with asterisk is due to the presence of matrix). Insets show experimental (left) and theoretical (right) isotopic distribution for $\text{Sc}_2\text{TiC}@C_{78}$.

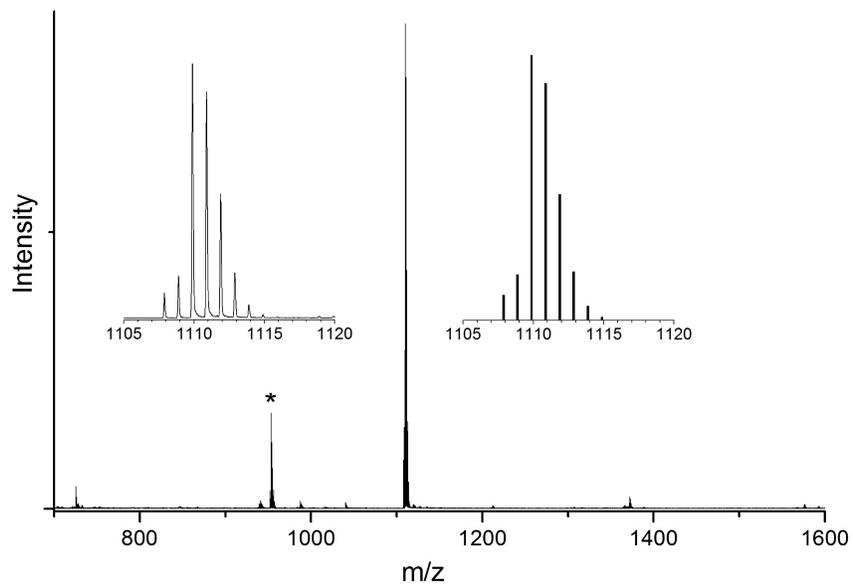

Figure S6b. Positive-ion MALDI Mass-spectrum of $\text{Sc}_2\text{TiC}@I_h\text{-C}_{80}$ (sulfur is used as a matrix, the feature marked with asterisk is due to the presence of matrix). Insets show experimental (left) and theoretical (right) isotopic distribution for $\text{Sc}_2\text{TiC}@C_{80}$.

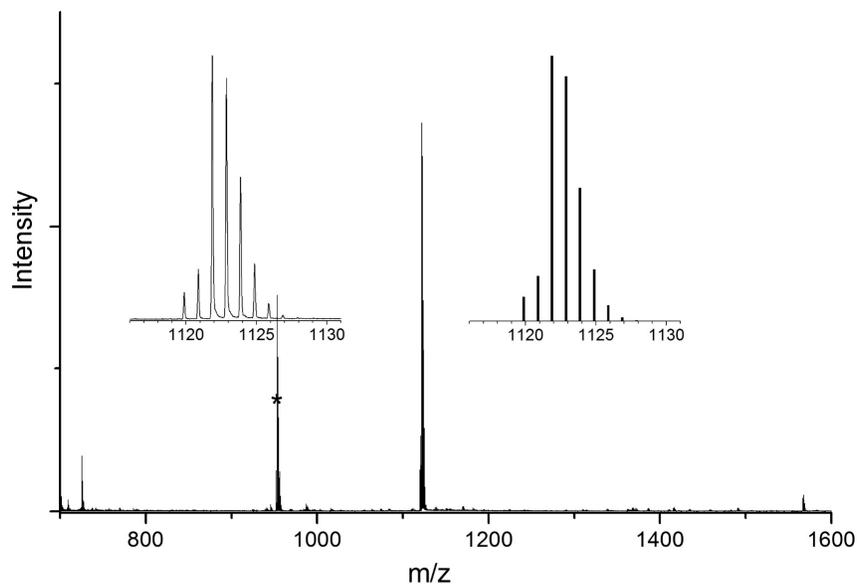

Figure S6c. Positive-ion MALDI Mass-spectrum of $\text{Sc}_2\text{TiC}_2@I_h\text{-C}_{80}$ (sulfur is used as a matrix, the feature marked with asterisk is due to the presence of matrix). Insets show experimental (left) and theoretical (right) isotopic distribution for $\text{Sc}_2\text{TiC}_2@C_{80}$.

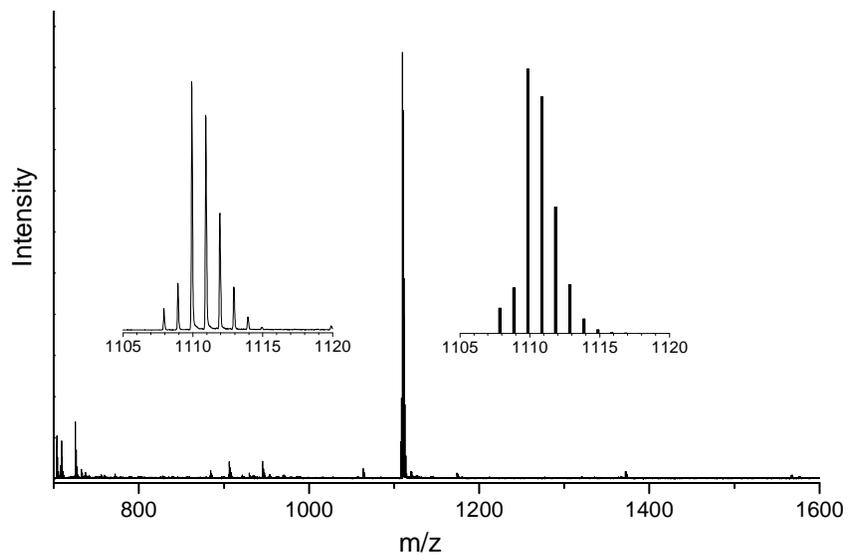

Figure S6d. Positive-ion MALDI Mass-spectrum of $\text{Sc}_2\text{TiC}@D_{5h}\text{-C}_{80}$ (sulfur is used as a matrix). Insets show experimental (left) and theoretical (right) isotopic distribution for $\text{Sc}_2\text{TiC}@C_{80}$.

UV-Vis-NIR absorption spectra

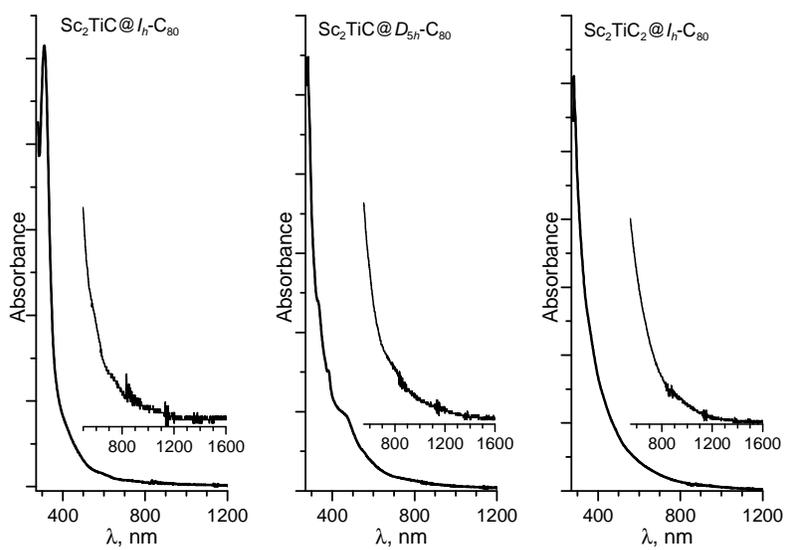

Figure 7a. UV-vis-NIR absorption spectra of $\text{Sc}_2\text{TiC}@I_h\text{-C}_{80}$, $\text{Sc}_2\text{TiC}@D_{5h}\text{-C}_{80}$, and $\text{Sc}_2\text{TiC}_2@I_h\text{-C}_{80}$ in toluene solution. Insets show enhanced NIR region.

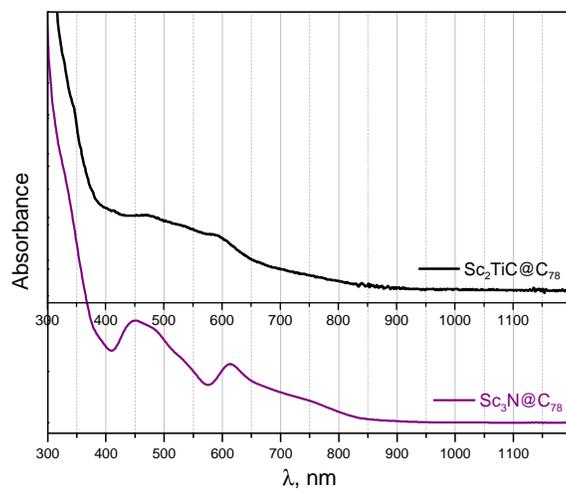

Figure 7b. UV-vis-NIR absorption spectrum of $\text{Sc}_2\text{TiC}@C_{78}$ in toluene compared to that of $\text{Sc}_3\text{N}@C_{78}$. Similarity of the spectra indicates that both EMFs may have the same carbon cage, $D_{3h}(5)\text{-C}_{78}$.

DFT-optimizes conformers of $\text{Sc}_2\text{TiC}_2@I_h\text{-C}_{80}$

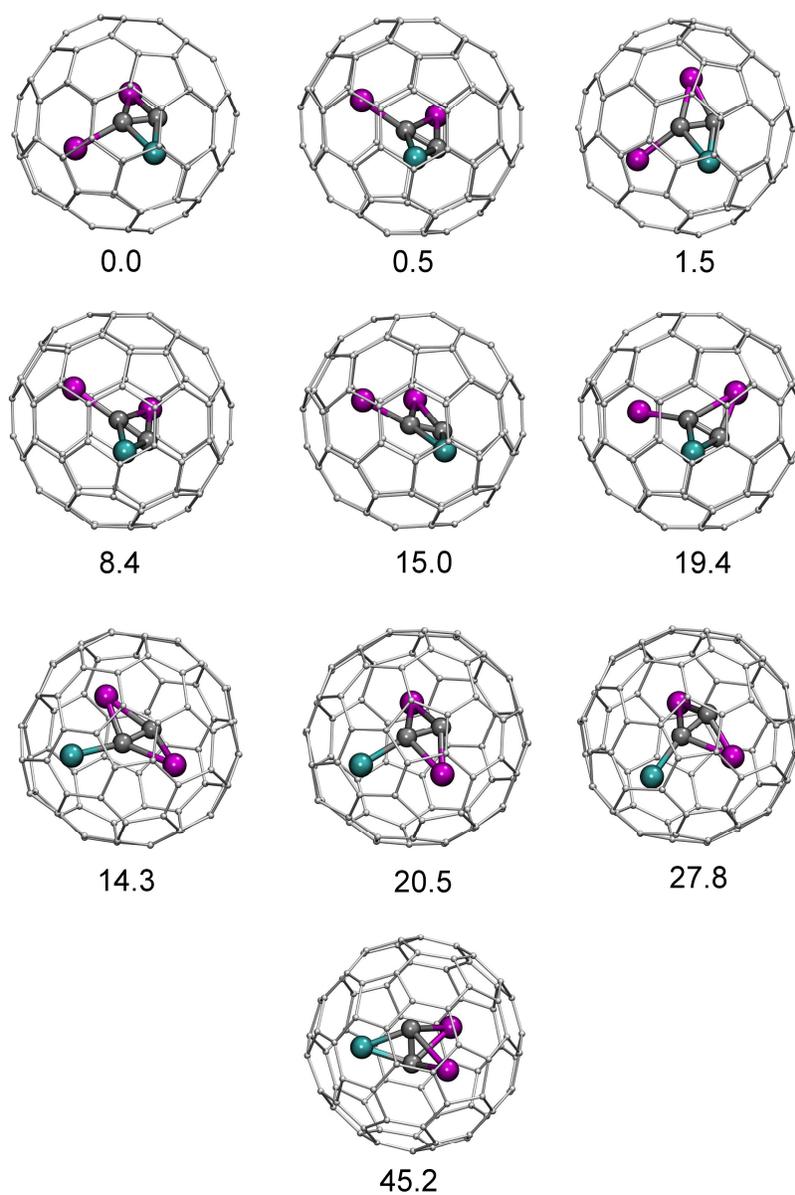

Figure 8. Selected DFT-optimized conformers of $\text{Sc}_2\text{TiC}_2@I_h\text{-C}_{80}$. Sc is magenta, Ti is cyan, endohedral carbons are dark grey. The value below each structure is its relative energy (in kJ/mol).

C₂ rearrangement in Sc₂TiC₂@I_h-C₈₀

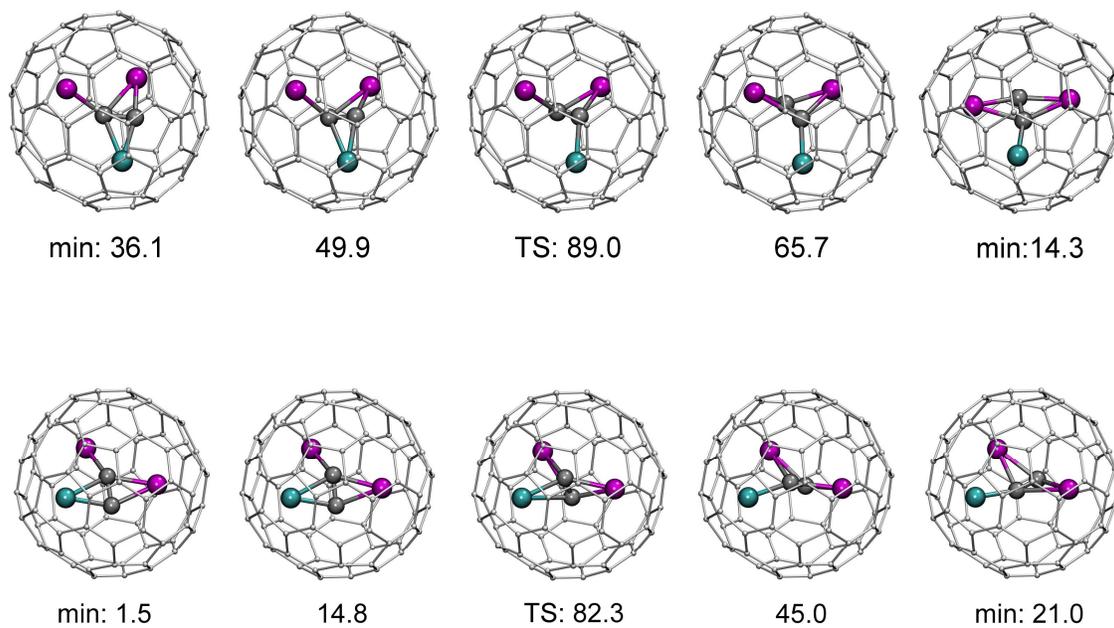

Figure 9. Selected structures on two intrinsic reaction coordinate (IRC) paths between two minima with different Ti-C₂ coordination (denoted as “min”) via transition state (denoted “TS”); relative energies are in kJ/mol
